

The effect of income as a factor affecting families' food expenditures is shown by the next chart (Fig. 8). In this chart, it is important to note that factors other than income have not been held constant. The average family size for the two lowest income classes shown on the chart is considerably lower than that of the top three classes. In comparing income-expenditure relationships between 1955 and 1965, we have made some adjustments for difference in family size and have plotted the data for food at home and for food away from home on double log scale (Fig. 9). It appears from these data that the
