

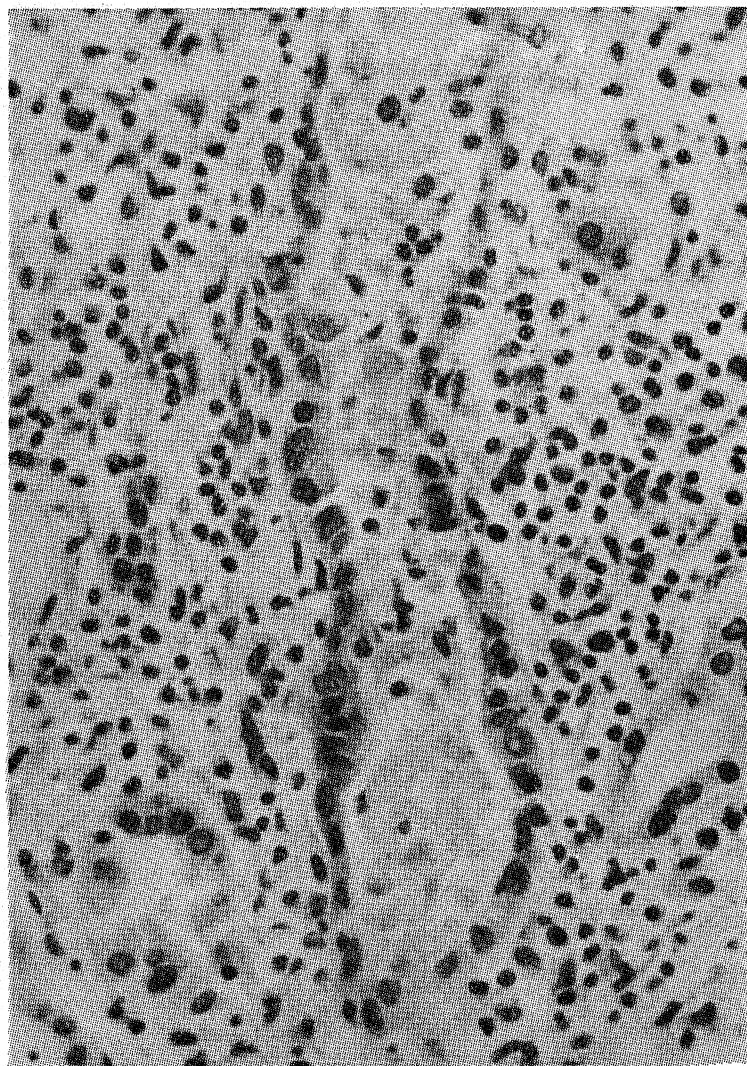

FIGURE 3. *Interstitial Accumulation of Leukocytes in Biopsy of M.L.*

*Most of the leukocytes are mononuclear cells although numerous eosinophils are also seen. The tubule shows various degenerative changes and several areas of necrosis.*

with antibenzylpenicilloyl serum. Thus, the presence of DPO haptenic groups was demonstrated in the kidney.

Whether the DPO groups were coupled directly to the kidney structural protein or whether they were present as part of soluble antigen-antibody complexes
