

with her sequential
oral contraceptive

Weight gain, a troublesome side effect with combination agents, is not a major problem with C-Quels for possibly two reasons:

- C-Quens does not produce the state of pseudopregnancy observed with combination products.
- The progestational component of C-Quens does not exhibit the anabolic effects noted with some testosterone derivatives.

C-Quens

Subjects received a daily morning (0800 h) dose of 20 mg of metoprolol plus five tablets each containing 10 mg of metoprolol and 2 mg of atenolol in the evening.
