

Now, here you see the aluminum guardrail protected with a barrier. This is in New Jersey. I guess they know it is not safe there, so they put a barrier there as a guardrail to keep the cars out.

As you can see here we have trouble constantly. I am showing you all different locations so you cannot say it is only there.

I feel a simple solution, when you are pouring the concrete walls, is just to go up a couple of feet higher. I do not think it will cost much
