

These results greatly exceeded those anticipated by all concerned. Fully 21 percent of the study group had been for all practical purposes dry since discharge until the time of the follow-up interview (see category 7). This time averaged a lapse of approximately 120 days of total sobriety. Certainly, by any standards, this 21 percent would represent unqualified success in treatment outcome. Below is a table of the ratings for the before and after treatment measures.

Ratings	1	2	3	4	5	6	7	Total
Before treatment.....	31	18	12	15	15	9	-----	100
After treatment.....	21	12	9	7	14	16	21	100

Following are two histograms which graphically illustrate the transitions in ratings achieved from the before-admission drinking patterns to the after-treatment drinking patterns displayed at the time of the follow-up interview.

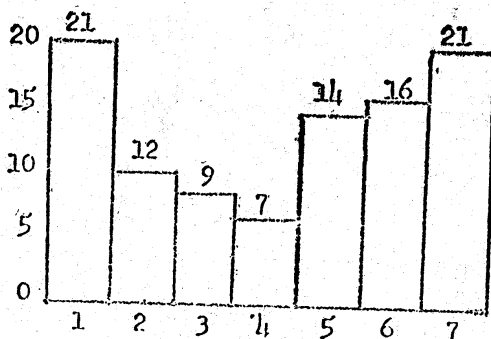

DRINKING SCALE

Before Treatment

Total Rated - 100

After Treatment

Total Rated - 100

RATINGS BASED ON DRINKING PATTERNS
DISPLAYED - 1 (most severe) to 7 (least severe)
