

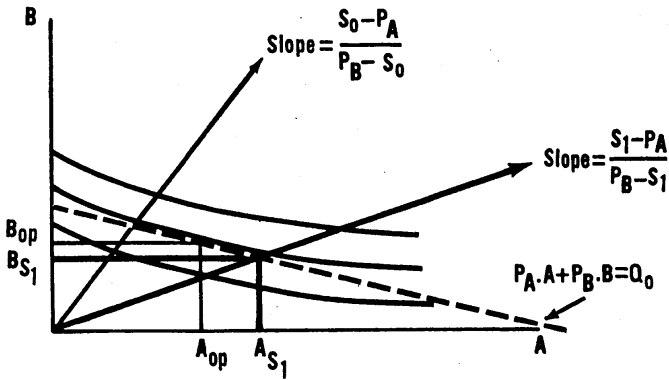

Figure 6

When $S = S_0$, the constraint is irrelevant.

When $S = S_1$, $S_1 < S_0$ so that $\frac{S_1 - P_A}{P_B - S_1} < \frac{B_{op}}{A_{op}}$

$$C(A_{S1}, B_{S1}) = C(A_{op}, B_{op})$$

but

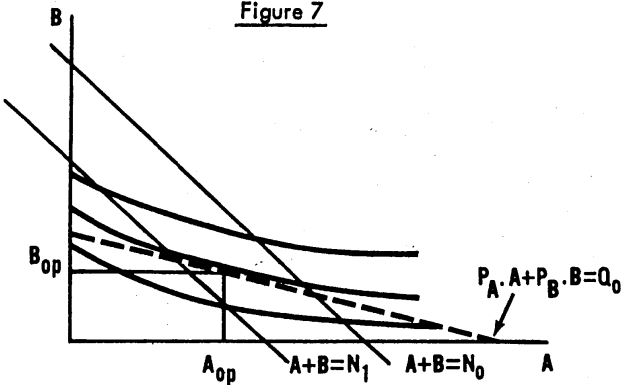

$$E(A_{op}, B_{op}) > E(A_{S1}, B_{S1}).$$

Thus when the average-salary constraint is not irrelevant, it always reduces effectiveness in terms of productivity per dollar of cost.

3.3 Effect of Control over Total Spaces

The statement of this constraint is $A + B = N$.

Figure 7

Once again, when $N = N_0$ the constraint is irrelevant, and when $N = N_1$ it reduces effectiveness.
