

Mr. CRAMER. We had a similar problem relating to the hurricane protection in Hillsborough River. It has got 1.2, as I remember. It is a hydrological study being proposed, what-have-you, and there could be a similar effect relating to it, possibly. So I just am interested in the fact that we are judging these projects on the one criteria, which a year from now might be unfeasible based upon the new criteria.

This is something we are always running into, relating to the basic criteria being required.

I had some other questions on this, but time does not permit.

Mr. BLATNIK. This will conclude our hearings just for today, until further notice of the Chair. Further testimony by the Corps of Engineers will be continued. This will conclude your testimony for this morning, gentlemen.

I thank you and your staff and your associates.

The hearings for this morning are adjourned.

(Whereupon, at 1:20 p.m., the subcommittee was adjourned until further notice of the Chair.)
